ITM426, Quiz 2, 2022 Fall

Solution and Grading

• ITM 426 Engineering Mathematics

• Oct 28, 2022
• Duration: 90 minutes
\bullet Weights: 25% or 30% depending on other quiz scores
• 6 Questions
• Name:
• Student ID:
• E-mail:@seoultech.ac.kr
• Write legibly.
• Justification is necessary unless stated otherwise.

• Partial points are given only sparingly for the most problems because you are expected to 1) carry

out proper sanity check and 2) correct your mistake by doing so.

1	25
2	15
3	15
4	15
5	15
6	15
Total	100

#1. Mark True or False. No justification is necessary. [Each 5pt]

- Every matrix is row equivalent to a unique matrix in echelon form. (TRUE / FALSE)
- Any system of n linear equations in n variables has at most n solutions. (TRUE / FALSE)
- If a system of linear equations has no free variables, then it has a unique solution. (TRUE / FALSE)
- If A is an $n \times n$ matrix, then the equation $A\mathbf{x} = \mathbf{b}$ has at least one solution for each \mathbf{b} in \mathbb{R}^n . (TRUE / FALSE)
- If matrix A is an $n \times n$ and the equation $A\mathbf{x} = \mathbf{0}$ has a nontrivial solution, then A has fewer then n pivot positions.

 (TRUE / FALSE)

Difficulty: Hard Amount of work: 25 % Suggested answer:

- False. The word "reduced" is missing.
- False. False. Counterexample: Let A be any $n \times n$ matrix with fewer than n pivot columns. Then the equation $A\mathbf{x} = \mathbf{0}$ has infinitely many solutions. Theorem 2 in Section 1.2 says that a system has either zero, one, or infinitely many solutions, but it does not say that a system with infinitely many solutions exists.
- False. Some systems may have no free variables and no solution.
- \bullet False. Only if the matrix A is invertible.
- True. By invertible matrix theorem.

#2. Find all solutions to the system of the homogeneous equations of A. [15pt]

$$A = \left[\begin{array}{rrrr} 1 & 3 & 9 & 2 \\ 1 & 0 & 3 & -4 \\ 0 & 1 & 2 & 3 \\ -2 & 3 & 0 & 5 \end{array} \right]$$

Difficulty: Easy Amount of work: 15 % Suggested answer:

#3. Find an LU factorization of the following matrix [15pt]

$$A = \left[\begin{array}{rrr} 2 & -2 & 4 \\ 1 & -3 & 1 \\ 3 & 7 & 5 \end{array} \right]$$

Difficulty: Easy

Amount of work: 15 % Suggested answer:

$$\begin{bmatrix} 1 & 0 & 0 \\ 1/2 & 1 & 0 \\ 3/2 & -5 & 1 \end{bmatrix} \cdot \begin{bmatrix} 2 & -2 & 4 \\ 0 & -2 & -1 \\ 0 & 0 & -6 \end{bmatrix}$$
 (1)

#4. Find an inverse of the following matrix [15pt]

$$A = \left[\begin{array}{rrr} 1 & -5 & -4 \\ 0 & 3 & 4 \\ -3 & 6 & 1 \end{array} \right]$$

Difficulty: Medium Amount of work: 15 % Suggested answer:

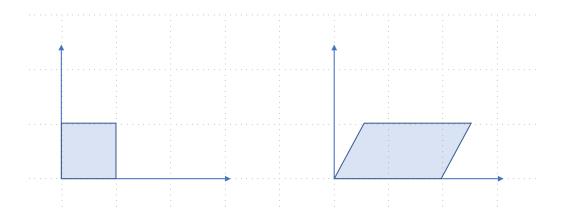

$$A^{-1} = \begin{bmatrix} -7 & -20/3 & -8/3 \\ -4 & -11/3 & -4/3 \\ 3 & 3 & 1 \end{bmatrix}$$

#5. Suppose A and B are $n \times n$, B is invertible, and AB is invertible. Show that A is invertible. [15pt]

Difficulty: Medium Amount of work: 15 % Suggested answer:

Let C = AB. Then $CB^{-1} = ABB^{-1}$, so $CB^{-1} = AI = A$. This shows that A is the product of invertible matrices, hence invertible.

#6. The unit square on the left becomes the parellogram on the right by a linear transformation. What would be the standard matrix for this linear transformation? Justification is necessary. [15pt]

Difficulty: Medium Amount of work: 15 % Suggested answer:

It is by shears of k=0.25 with respect to x-axis, then doubling x-axis. Thus, the standard matrix is $\begin{bmatrix} 2 & 0.5 \\ 0 & 1 \end{bmatrix}$
